1 Analyzer

The Analyzer is what analyzes the syntax trees generated by the Parser and ensures that everything is valid.

```
module Analyzer where
import AST
import Result
```

The analyze function is the heart of this whole system, kicking off the whole process of inferring and checking types. If all works out correctly, it returns 0k True. If not, a Fail with a reason.

```
\begin{array}{l} \mathtt{analyze} \ :: \ \mathtt{AST} \ \to \ \mathtt{Result} \ \mathtt{Bool} \\ \mathtt{analyze} \ \mathtt{ast} = \mathtt{Ok} \ \mathtt{True} \end{array}
```
